Calcul de l'entropie résiduelle de la glace carrée

Silvère Gangloff

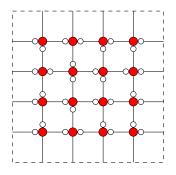

LIP, ENS Lyon

October 4, 2018

États stables de la glace carrée [Pauling-Lieb]:

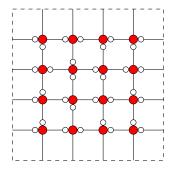

États stables de la glace carrée [Pauling-Lieb]:

E.H. Lieb, Residual entropy of square ice, Physical Review, 1967.

États stables de la glace carrée [Pauling-Lieb]:

E.H. Lieb, Residual entropy of square ice, Physical Review, 1967.

Valeur de l'entropie?

Motivations:

Lieb: confirmation du modèle de la glace.

Motivations:

Lieb: confirmation du modèle de la glace.

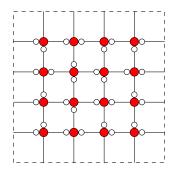

MC2: méthodes de calcul de l'entropie des SFT multidimensionnels.

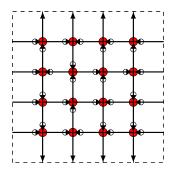

Motivations:

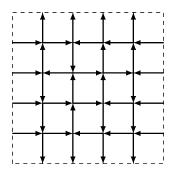

Lieb: confirmation du modèle de la glace.

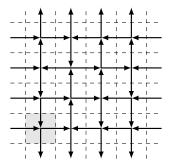

MC2: méthodes de calcul de l'entropie des SFT multidimensionnels.

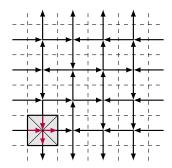

But de l'exposé: 'calcul' de la l'entropie de la glace.

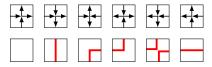

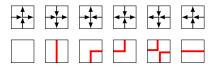

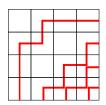

Représentation par courbes discrètes [Folklore]:

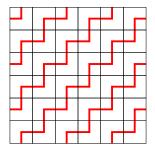

Représentation par courbes discrètes [Folklore]:

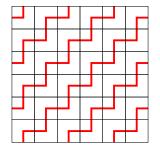

Condition toroïdale [Lieb, Preuve Duminil-Copin et al.]:

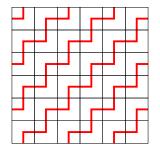

Condition toroïdale [Lieb, Preuve Duminil-Copin et al.]:

H. Duminil-Copin et al., Discontinuity of the phase transition for the planar random-cluster and Potts models with q > 4.

Condition toroïdale [Lieb, Preuve Duminil-Copin et al.]:

H. Duminil-Copin et al., Discontinuity of the phase transition for the planar random-cluster and Potts models with q > 4.

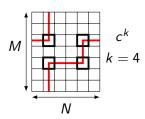

Suffisant: compter les motifs valides sur un tore

Fonction de partition: c > 0:

Fonction de partition: c > 0:

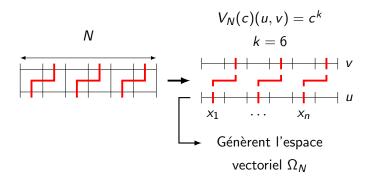

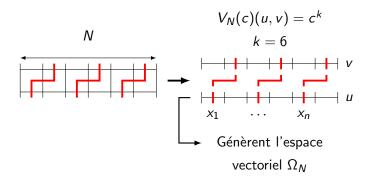

Fonction de partition: c > 0:

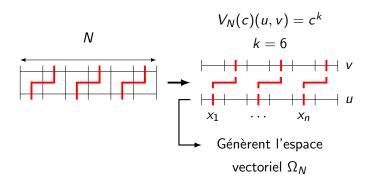

$$P_{N,M}(c) = \sum_{\text{motifs}} c^{k(\text{motif})}$$

$$P_{N,M}(c) = Tr(V_N(c)^M)$$

Entropie 'lestée' [Lieb]:

Entropie 'lestée' [Lieb]:

$$h_c = \lim_{N \to M} \lim_{M \to M} \frac{\log(Tr(V_N(c)^M))}{M}$$
 et $h_1 = h_{top}$

$$h_c = \lim_{N} \frac{\log(\lambda_{max}(V_N(c))))}{N}$$

$$h_c = \lim_{N} \frac{\log(\lambda_{max}(V_N(c))))}{N}$$

La fonction $c>0\mapsto \lambda_{max}(V_N(c))$ est un **polynôme [Baxter]**

$$h_c = \lim_{N} \frac{\log(\lambda_{max}(V_N(c))))}{N}$$

La fonction $c>0\mapsto \lambda_{max}(V_N(c))$ est un **polynôme [Baxter]**

T.J. Baxter, Exactly solved models in statistical mechanics, 1982.

Pour tous c, c' > 0, $V_N(c)$, $V_N(c')$ commutent.

Pour tous c, c' > 0, $V_N(c)$, $V_N(c')$ commutent.

Donc $\exists P$ inversible t.q. $\forall c > 0$,

$$V_N(c) = P \left(\begin{array}{ccc} \lambda_1(c) & \dots & 0 \\ \vdots & \ddots & \vdots \\ 0 & \dots & \lambda_{2^N}(c) \end{array} \right) P^{-1}$$

Pour tous c, c' > 0, $V_N(c)$, $V_N(c')$ commutent.

Donc $\exists P$ inversible t.q. $\forall c > 0$,

$$V_N(c) = P \left(egin{array}{ccc} \lambda_1(c) & \dots & 0 \\ dots & \ddots & dots \\ 0 & \dots & \lambda_{2^N}(c) \end{array}
ight) P^{-1}$$

Perron-Frobenius [matrices symétriques irréductibles]: o.p.s. que $\lambda_1(c) = \lambda_{max}(V_N(c))$ pour tout c > 0.

Bethe ansatz [classique φ stat.]:

Bethe ansatz [classique φ stat.]: Si $(p_j)_{j=1}^n \in (-\pi,\pi)^n$ telle que:

Bethe ansatz [classique φ stat.]: Si $(p_j)_{i=1}^n \in (-\pi,\pi)^n$ telle que:

$$Np_j = 2\pi \left(j - \frac{n+1}{2}\right) - \sum_{k=1}^n \Theta(p_i, p_j)$$

Bethe ansatz [classique φ stat.]: Si $(p_j)_{j=1}^n \in (-\pi,\pi)^n$ telle que:

$$Np_j = 2\pi \left(j - \frac{n+1}{2}\right) - \sum_{k=1}^n \Theta(p_i, p_j)$$

où
$$\Theta(0,0)$$
,

$$e^{-i\Theta(x,y)} = e^{i(x-y)} \frac{e^{ix} + e^{-iy} - 2\Delta}{e^{-ix} + e^{-iy} - 2\Delta},$$

et
$$\Delta = (2 - c^2)/2$$
,

$$\varphi_{n}(x_{1},...,x_{n}) = \sum_{\sigma \in \Sigma_{n}} A_{\sigma} \prod_{k=1}^{n} \exp(ip_{\sigma(k)}x_{k})$$

$$\varphi_{n}(x_{1},...,x_{n}) = \sum_{\sigma \in \Sigma_{n}} A_{\sigma} \prod_{k=1}^{n} \exp(ip_{\sigma(k)}x_{k})$$

$$\lambda_n = \prod_{j=1}^n \left(1 + \frac{c^2 e^{ip_j}}{1 - e^{ip_j}} \right) + \prod_{j=1}^n \left(1 - \frac{c^2}{1 - e^{ip_j}} \right)$$

$$\varphi_n(x_1,...,x_n) = \sum_{\sigma \in \Sigma} A_{\sigma} \prod_{k=1}^n \exp(ip_{\sigma(k)}x_k)$$

$$\lambda_n = \prod_{j=1}^n \left(1 + \frac{c^2 e^{ip_j}}{1 - e^{ip_j}} \right) + \prod_{j=1}^n \left(1 - \frac{c^2}{1 - e^{ip_j}} \right)$$

alors

$$V_N(c)\varphi_n=\lambda_n.\varphi_n$$

$$\varphi_n(x_1,...,x_n) = \sum_{\sigma \in \Sigma_n} A_{\sigma} \prod_{k=1}^n \exp(ip_{\sigma(k)}x_k)$$

$$\lambda_n = \prod_{j=1}^n \left(1 + \frac{c^2 e^{ip_j}}{1 - e^{ip_j}} \right) + \prod_{j=1}^n \left(1 - \frac{c^2}{1 - e^{ip_j}} \right)$$

alors

$$V_N(c)\varphi_n=\lambda_n.\varphi_n$$

Remarque: $\lambda_n \neq 0$?, $\varphi_n \neq 0$?

Hypothèse: $\exists c \mapsto (p_j(c))_j$ analytique.

Hypothèse: $\exists c \mapsto (p_j(c))_j$ analytique.

$$V_{N}(\infty) \equiv \lim_{c} \frac{1}{c^{N/2}} V_{N}(c).$$

$$V_{N}(\infty) = \begin{pmatrix} 0 & 1 & 0 & \dots & 0 \\ 1 & 0 & & & & \\ 0 & & 0 & & \vdots \\ \vdots & & & \ddots & 0 \\ 0 & & \dots & 0 & 0 \end{pmatrix}$$

Hypothèse: $\exists c \mapsto (p_i(c))_i$ analytique.

$$V_N(\infty) \equiv \lim_c \frac{1}{c^{N/2}} V_N(c).$$

$$V_N(\infty) = \left(egin{array}{cccc} 0 & 1 & 0 & \dots & 0 \\ 1 & 0 & & & & \\ 0 & & 0 & & dots \\ dots & & & \ddots & 0 \\ 0 & & \dots & 0 & 0 \end{array}
ight)$$

Hypothèse: $\exists c \mapsto (p_i(c))_i$ analytique.

$$V_N(\infty) \equiv \lim_c \frac{1}{c^{N/2}} V_N(c).$$

$$V_{\mathcal{N}}(\infty) = \left(egin{array}{cccc} 0 & 1 & 0 & \dots & 0 \ 1 & 0 & & & & \ 0 & & 0 & & dots \ dots & & & \ddots & 0 \ 0 & & \dots & 0 & 0 \end{array}
ight)$$

Donc
$$\lambda_{max}(V_N(\infty)) = 1$$

$$\frac{1}{c^{N/2}}\lambda_{N/2}\to 1$$

$$\frac{1}{c^{N/2}}\lambda_{N/2} \to 1$$

Au voisinage de $+\infty$:

$$\lambda_{N/2} = \lambda_{max}(V_N(c))$$

$$\frac{1}{c^{N/2}}\lambda_{N/2} \to 1$$

Au voisinage de $+\infty$:

$$\lambda_{N/2} = \lambda_{max}(V_N(c))$$

$$\lambda_{N/2} \equiv \lambda_{max}(V_N(c))$$

$$\frac{1}{c^{N/2}}\lambda_{N/2}\to 1$$

Au voisinage de $+\infty$:

$$\lambda_{N/2} = \lambda_{max}(V_N(c))$$

$$\lambda_{N/2} \equiv \lambda_{max}(V_N(c))$$
